Javascript Validator (50\$ value)
jQuery Fileuploader (12\$ value)

What is PHP Form Builder?

PHP Form Builder is a complete library based on a PHP class, which allows you to program any type of form and layout them using simple functions and/or using its drag & drop form generator.

Forms can both be generated with Drag & drop and/or programmed in PHP.

PHP Form Builder includes the best Javascript plugins available and allows you to implement them in a very simple and elegant way.

Validation (live and server side), sending emails and records in a database are also extremely simplified.

The documentation is suitable for both novice PHP users and experienced programmers.

Numerous examples of code are available: Templates, How to, Function reference, ...

Quick & efficient help guaranteed.

Please note that, unlike most other Form Builders, PHP Form Builder does not have a built-in backend. This allows users to manage form data as they see fit.

The provided PHP PDO class provides all the necessary functions for inserting/editing records in a MySQL database.

Looking for a CRUD Generator?

PHP Crud Generator, another of our tools available on Codecanyon, will be perfect for that purpose. Suitable for both programmers and non-programmers.

Main features

Build any form with any framework

Validate posted values

Send your emails using customizable html/css templates

Connect your database and Insert, Update or Delete records

300+ prebuilt templates included
