Description

WP Reset V1.98 WP Plugin Free Download

WP Reset V1.98, quickly resets the site's database to the default installation values without modifying any files. It deletes all customizations and content, or just chosen parts like theme settings. WordPress Reset is fast and safe to use thanks to the built-in snapshots which provide 1-click restore functionality. It has multiple fail-safe mechanisms so you can never accidentally lose data. WP Reset is extremely helpful for plugin and theme developers. It speeds up testing & debugging by providing a quick way to reset settings and re-test code. It's the only WP development tool for non-developers that enables advanced reset.

Access WP Reset admin page via the "Tools" menu.

Please read carefully before proceeding to understand what WP Reset does, and remember to always create a snapshot

RESETTING WILL DELETE:

all posts, pages, custom post types, comments, media entries, users

all default WP database tables

all custom database tables that have the same prefix table prefix as the one defined in wp-config.php and used by default tables

RESETTING WILL NOT DELETE OR MODIFY:

media files – they remain in the wp-uploads folder untouched but will no longer be listed under Media in admin

no files are touched; plugins, themes, uploads – everything stays

site title, WordPress address, site address, site language and search engine visibility settings

currently logged in user will be restored with the current username and password

WHAT HAPPENS WHEN I CLICK THE RESET BUTTON?

remember to always create a snapshot first or a full backup

you will have to confirm the action one more time because there is NO UNDO

everything will be reset; see bullets above for details

site title, WordPress address, site address, site language, search engine visibility settings as well as the current user will be restored

you will be logged out, automatically logged in and taken to the admin dashboard

WP Reset plugin will be reactivated if that option is chosen in the post-reset options

UNDOING A RESET

Before doing a reset, create a snapshot. The button is located right next to the reset button and it takes less than 10 seconds to create a snapshot. After reset is done, if you need to undo it simply restore the snapshot and that's it.

WP-CLI SUPPORT

WP Reset comes with full WP-CLI support. Help on our WP-CLI commands is available via `wp help reset`. By default the commands have to be confirmed but you can use the `--yes` option to skip confirmation. Instead of the active user, the first user with admin privileges found in the database will be restored after reset. Please be careful when using WP Reset with WP-CLI – as with using the GUI always make a snapshot or backup first.

Currently supported WP-CLI commands:

```
wp reset reset
wp reset version
wp reset delete
wp reset snapshots
```

DATABASE SNAPSHOTS

Database snapshot is a copy of all WP database tables, standard and custom ones, saved in the currently used database [as set by `wp-config.php`]. Files are not saved or included in snapshots in any way.

Snapshots are primarily a development tool. Although they can be used for backups (and downloaded as gzipped SQL dumps), we suggest finding a more suitable tool for doing backups of live sites. Use snapshots to find out what changes a plugin made to your database – what custom tables were created, modified, deleted or what changes were made to site's settings. Or use it to quickly restore the development environment after testing database related changes.

Restoring a snapshot does not affect other snapshots, or WP Reset settings. Snapshots can be compared to current database tables, restored (by overwriting current tables), exported as gzipped SQL dumps, or deleted. Creating a snapshot on an average WordPress installation takes 1-2 seconds.

MULTISITE (WP-MU) SUPPORT

WP Reset has yet to be completely tested with multisite! Please be careful when using it with multisite enabled. We don't recommend to resetting the main site. Sub-sites should be OK. We're working on making WP Reset fully compatible with WP-MU. Till then please be careful. Thank you for understanding.

PARTIAL RESET TOOLS

Delete transients – deletes all transient related database entries. Including expired and non-expired transients, and orphaned timeout entries.

Delete uploads – delete all files and folder in the `/uploads/` folder.

Delete plugins – deletes all plugins except WP Reset which remains active.

Reset theme options – resets all options for all themes that use the WP theme mods API.

Delete themes – deletes all themes.

Empty or delete custom tables – empties (truncates) or deletes (drops) all custom database tables.

Delete `.htaccess` file – deletes the `.htaccess` file. If you need to edit `.htaccess` without FTP use our free WP Htaccess Editor plugin.

GDPR COMPATIBILITY

We are not lawyers. Please do not take any of the following as legal advice.

WP Reset does not track, collect or process any user data on the front end. Nothing is logged or pushed to any 3rd parties. We also don't use any 3rd party services or CDNs. All actions are performed in the admin and started exclusively on users' request. If you opt to activate your PRO license in the plugin, some data will be shared with WebFactory Ltd; that's clearly noted below the license activation form. Based on that, we feel it's GDPR compatible, but again, please, don't take this as legal advice.
